Industrial Fair Dusseldorf-2008

Dear Doctor Schapiro,

As a follow-up to the discussion between you and Dr. Faymonville during Industrial Fair Dusseldorf-2008, we would like to express our gratitude for your visit to our exhibit and your keen interest in our scientific activities. We are especially grateful for your confidence in sharing with us your business concept for the development of the RKM Technology.

Upon consideration of the RKM machines with rotating pistons as basic technology, we saw a number of common points and an opportunity to use them in those areas of innovation, which are of special interest to GASA. They are, first and foremost, the areas of practical application of new technologies, in particular those where we can renew existing technologies and create new ways for their practical application through the development of prototypes.

We took a positive decision on the possibility of cooperation with your firm, and are prepared to consider all aspects of such cooperation in all details. We are in the process of coordinating our plan with the R&D sub-divisions of GASA specializing in the development of new vehicles, drives, robotics, mechatronics, and other new technologies. The following areas of our work are of a particular interest for applying the RKM Technology:

GASA's lawful representative is the Executive Board. The Board has the right to appoint authorized representatives. Information on authorized representatives and the extent of their powers may be obtained from Director of the GASA Legal Department, 51170 Köln.

GASA is certified under the ISO 9001-2000 standard, certificate No. 01 100 050700.

DLR, Porz-Wahnheide, Linder Höhe, 51147 Köln

Internet site www.DLR.de

- New concepts for vehicles, development of alternative drives for various means of transportation;
- Using solar energy, utilizing water steam in combination with fuels;
- Systems for rockets and air transport;
- Hydraulic drives and compressors for liquid and gaseous fuel systems.

We have based the above of the information posted on you Internet site at www.rkm-schapiro.org. As may be necessary for more detailed discussions, we will ask you for additional information and personal meetings with our staff.

One of our R&D sub-divisions, the GASA Institute of Technology, specializes in precision mechanics and serves as a technical base for other sub-divisions working on projects for aerospace industry. It is a key sub-division in the development of new transportation and energy systems. Its activities significantly lower the risks and facilitate introduction of the results of R&D work into production.

GASA usually assumes in new ventures a minority position with a share of voting stock of up to 24.9 percent, and invests in them its mature proprietary technologies in the form of patents and know-how. GASA does not participate in capitalization of new venture, with the exception of providing its share of the initial capital required by law. We expect that capitalization of a new venture will be carried out by investors providing start-up or venture funds. GASA will actively support negotiations with such investors during the initial phases of the venture.

Please also note that currently GASA is working on creating a new sub-division, TE Power, which will act on our behalf as a holding company in the new ventures. If this sub-division will be created, cooperation with your firm would fall under its purview. Kindly take this into consideration as a framework condition when creating the business plan and corporate documents for the cooperative venture. We have appointed Dr. Rudolf Faymonville as the executive authorized to act on our behalf during creation of the new venture with your firm.

With kind regards,
